VISITOR MODULE

FoxSec Visitor Module

FoxSec Visitor Module is designed to allow visitors to enter the building or territory. It is determined to which doors he has the right to enter. Visitor's data is entered into the system. Date, validation time and duration of given premissions are previously set.

There are several options for using the Visitor Module – with pin code reader, qr code reader, or RFID card

- PIN - In this case a PIN reader is installed. The unique pin number is generated and sent to the „visitor“ by the e-mail. The visitor user rights are preprogrammed and the PIN is linked to the user in the system.

- QR-code – a QR-code reader is installed at the entrance. The administrator fills in the visitor's and the permissions (visiting time and allowed doors).

The link with the QR code is sent to the visitors email.

The QR-code is convenient to use, as shared rights are short-term, and to ensure security, the rights of passable doors are limited. For example, the visitor has rights to enter through the main door and move on to the meeting room.

The Visitor Module also allows the guest to enter the company's parking lot by using the registration number recognition system or QR-code

- Access card – possibility to use access cards as guest cards to move around the building. Similar to QR and PIN codes, rights are determined in advance in the system, which doors the visitor is allowed to move through and whether accompanied or without. In this case, rights must be assigned and the card issued on arrival. For quick and more convenient registration of the guest card in the system, it is possible to authorize the card with a table reader

FEATURES:

- Search for visitors by country, location, building, company name
- Possibility to add a visitor photo through the computer or take a photo on the spot through a web camera
- Ability to see who has or has not returned the visitor card
- Log of visitor movements

FoxSec offers flexible visitor management systems where you can easily manage door movements, parking lot entries, etc. through the system. Thanks to the user-friendly management interface, managing and adding visitors to the system is easy and secure.
